Development of New Methods for Selective and Efficient Chemical Synthesis

Durga Prasada Rao Hari

University of Bristol, BS, UK

Despite the changing face of chemistry, the impact of chemical synthesis - the ability to make organic molecules in a controlled manner - has not diminished. Nevertheless, the increasingly complex synthetic problems being created by nature, medicine and organic materials demand new concepts and strategies to meet these challenges. This webinar will describe new methods for selective and efficient chemical synthesis that I have developed in three different research areas: photocatalysis, hypervalent iodine chemistry and organoboron chemistry.
