Susceptibility of High-Density Lipoprotein to Oxidative Stress

Vasanthi Narayanaswami

CSU, Long Beach

Recently, the lipoprotein research community has been forced to go back to the drawing board to re-examine 'the HDL hypothesis' (inverse association between plasma [HDL cholesterol] and risk of cardiovascular disease, CVD, the #1 killer). This is considering numerous studies which revealed that simply raising HDL levels did not protect from CVD. Responding to the rallying cry to fill in the mechanistic details of HDL in CVD, this talk will focus on its susceptibility to oxidative stress with emphasis on a major resident apolipoprotein (apo), apoE.
