Trying to reach the bed from the bench: the gap remains

Sagar Sengupta

NII, New Delhi

Genome integrity in nucleus and mitochondria is one of the hallmarks of multiple cellular processes. The fundamental process which has driven genome integrity research has been the discovery phase – new players, newer pathways and a variety of interconnections between the old and newly discovered players and processes. While the above endeavour is no doubt fulfilling and adds to the rich tapestry of knowledge, it does beg the question – how to take the so called discoveries to the application level where they can potentially be of use to the common man. This seminar will try to tell the journey of a basic biologist interested in genome integrity and his attempts to bridge the gap between fundamental and applied biology.

Friday, Nov 11th 2022

11:30 AM (Tea/Coffee at 11:15 AM)

Auditorium, TIFR-H
